(54) Title: SULFUR SUBSTITUTED ARYLDIFLUOROMETHYLPHOSPHONIC ACIDS AS PTP-1B INHIBITORS

(57) Abstract: The invention encompasses the novel class of compounds represented by formula (I), which are inhibitors of the PTP-1B enzyme. The invention also encompasses pharmaceutical compositions and methods of treating or preventing PTP-1B mediated diseases, including diabetes.

5 TITLE OF THE INVENTION

SULFUR SUBSTITUTED ARYLDIFLUOROMETHYLPHOSPHONIC ACIDS AS PTP-1B INHIBITORS

BACKGROUND OF THE INVENTION

10 This invention relates to a novel class of phosphonic acid derivatives that are inhibitors of PTP-1B.

Protein tyrosine phosphatases are a large family of transmembrane or intracellular enzymes that dephosphorylate substrates involved in a variety of regulatory processes (Fischer et al., 1991, Science 253:401-406). Protein tyrosine
15 phosphatase-1B (PTP-1B) is a ~50 kd intracellular protein present in abundant amounts in various human tissues (Charbonneau et al., 1989, Proc. Natl. Acad. Sci. USA 86:5252-5256; Goldstein, 1993, Receptor 3:1-15).

Determining which proteins are substrates of PTP-1B has been of considerable interest. One substrate which has aroused especial interest is the insulin
20 receptor. The binding of insulin to its receptor results in autophosphorylation of the receptor, most notably on tyrosines 1146, 1150, and 1151 in the kinase catalytic domain (White & Kahn, 1994, J. Biol. Chem. 269:1-4). This causes activation of the insulin receptor tyrosine kinase, which phosphorylates the various insulin receptor substrate (IRS) proteins that propagate the insulin signaling event further downstream
25 to mediate insulin's various biological effects.

Seely et al., 1996, Diabetes 45:1379-1385 ("Seely") studied the relationship of PTP-1B and the insulin receptor *in vitro*. Seely constructed a glutathione S-transferase (GST) fusion protein of PTP-1B that had a point mutation in the PTP-1B catalytic domain. Although catalytically inactive, this fusion protein was
30 able to bind to the insulin receptor, as demonstrated by its ability to precipitate the insulin receptor from purified receptor preparations and from whole cell lysates derived from cells expressing the insulin receptor.

Ahmad et al., 1995, J. Biol. Chem. 270:20503-20508 used osmotic loading to introduce PTP-1B neutralizing antibodies into rat KRC-7 hepatoma cells.
35 The presence of the antibody in the cells resulted in an increase of 42% and 38%, respectively, in insulin stimulated DNA synthesis and phosphatidylinositol 3' kinase activity. Insulin receptor autophosphorylation and insulin receptor substrate-1 tyrosine phosphorylation were increased 2.2 and 2.0-fold, respectively, in the

5 antibody-loaded cells. The antibody-loaded cells also showed a 57% increase in insulin stimulated insulin receptor kinase activity toward exogenous peptide substrates.

Recently, Kennedy et al., 1999, Science 283: 1544-1548 showed that protein tyrosine phosphatase PTP-1B is a negative regulator of the insulin signalling
10 pathway, suggesting that inhibitors of this enzyme may be beneficial in the treatment of Type 2 diabetes. Mice lacking PTP-1B are resistant to both diabetes and obesity.

Therefore, inhibitors of PTP-1B improve insulin-sensitivity. They may have utility in controlling or treating Type 2 diabetes, in improving glucose tolerance, and in improving insulin sensitivity in patients in need thereof. The
15 compounds may also be useful in treating or controlling other PTP-1B mediated diseases, and may be useful in the treatment of cancer, neurodegenerative diseases and the like.

SUMMARY OF THE INVENTION

20 Compounds represented by formula I, including pharmaceutically acceptable salts thereof, and prodrugs thereof, are PTP-1B inhibitors that may be useful in the treatment of diabetes and related medical conditions. They may also be useful in the treatment of other PTP-1B mediated diseases.

35

Alkylene, alkenylene, alkynylene, fluoroalkylene, alkadienylene, and the like, where the suffix "ene" has been added to the name of the monovalent

5 radicals alkyl, alkenyl, alkynyl, fluoroalkyl, alkadienyl, and the like, describe divalent radicals that are the same as their monovalent counterparts, except that two hydrogen atoms rather than one are removed so that the radical will have two points of attachment, in addition to attachments to substituents which may also be present.

Aryl groups include 6-14 membered carbocyclic aromatic ring systems
10 comprising 1-3 phenyl rings. If two or more aromatic rings are present, then the rings are fused together, so that adjacent rings share a common side. Examples are benzene, naphthalene, anthracene and phenanthrene. Preferred aryl groups are benzene and naphthalene. Substitutions on these are defined herein.

Heteroaryl as used herein represents a 5-10 membered aromatic ring
15 system comprising one ring or two fused rings, 1-4 heteroatoms selected from the groups consisting of N, O, S(O)_x, and mixtures thereof wherein x is 0, 1 or 2, and 0-2 carbonyl groups. Carbonyl groups, when present, are not counted as heteroatoms. Heteroaryl includes, but is not limited to, furanyl, diazinyl, imidazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, oxazolyl, pyrazolyl, pyridyl, pyrrolyl, tetrazinyl, thiazolyl,
20 thienyl, triazinyl, triazolyl, 1*H*-pyrrole-2,5-dionyl, 2-pyrone, 4-pyrone, pyrrolopyridine, furopyridine and thienopyridine. Heteroaryl also includes benzoheteroaryl, defined below. Benzoheteroaryl is a subset of heteroaryl and includes aromatic ring
25 systems containing one or more heteroatoms which also have a fused 6-membered benzene ring, such as 2*H*-1-benzopyran-2-one, 4*H*-1-benzopyran-4-one, 2(3*H*)benzofuranone, 3(2*H*)benzofuranone, 2,3-dihydrobenzofuran, 2,3-dihydrobenzothiophene, indole, benzofuran, benzo thiophene, benzimidazole, benzoxazole, benzothiazole, benzotriazole, benzothiadiazone, 1*H*-isoindole-1,3(2*H*)-
30 dione, quinoline, and isoquinoline. Preferred benzoheteroaryl compounds include benzothiophene, benzothiazole, benzotriazole, benzothiadiazone, quinoline, and isoquinoline. Specific heteroaryls used in this invention include quinoline, thiazole, tetrazole, pyridine, pyrazole, oxadiazole, oxathiazole and oxazole.

Another subset of heteroaryls includes 5-membered heteroaryls, such
35 as the following:

10 When a heteroaromatic ring is specified as optionally having one or more heteroatoms, this means that at least one heteroatom is present, selected from O, S, SO, SO₂ and N, and up to 4 such heteroatoms may be present, depending upon the size of the ring specified.

When a moiety is specified as being optionally substituted, then the same moiety may also remain unsubstituted, unless otherwise stated.

15 Finally, when a list of possible choices is provided for a given moiety, and the moiety is used in more than one position in a chemical formula, the selection of a choice for the moiety in each position is independent of other selections, unless the definition specifically says otherwise.

Metabolites – Prodrugs

20 Metabolites of the compounds of this invention that are therapeutically active and that are described by formula I also are within the scope of the claimed invention, as are prodrugs, which are compounds that are converted to the claimed active compounds or salts of the claimed active compounds after they have been

5 administered to a patient. A non-limiting example of a prodrug of the phosphonic acids of this invention would be a monoester or diester of one or more phosphonic acid groups, where the ester functionality preferably has a structure that makes it easily hydrolyzed or metabolized after administration to a patient. Examples of prodrugs include C₁₋₆ alkyl esters of the phosphonic acids. Prodrugs that have

10 structures that are more easily hydrolyzed or metabolized are generally more preferred. Examples are illustrated by the structures below, where R' = H or a C₁₋₆ alkyl group, and R'' = C₁₋₆ alkyl group or -OC₁₋₆ alkyl group, and Q is the residue of the molecule that is attached to the -CF₂PO₃H₂ or -PO₃H₂ group in formula I. The alkyl groups and alkoxy groups may optionally be substituted with one or more

15 substituents independently selected from 1-5 halogen atoms, a phenyl group, or a mixture of these. The phenyl group, if present, may optionally be substituted with 1-3 substituents independently selected from halogen, -CH₃, -CF₃, -OCH₃ and -OCF₃. In these compounds, and as defined in general throughout this application, the alkyl groups and the alkyl portions of Oalkyl groups may be linear or branched and may

20 optionally be cycloalkyl or may include a cycloalkyl group in their structure. For examples of prodrug structures related to those shown below, see D.N.Srinivasta et al., Bioorganic Chemistry 12, 118-129 (1984).

25

Other ester functionalities that may be used in the monoester or diester

30 phosphonate prodrugs include phenyl esters and benzyl esters, where the phenyl ester groups have the structure -Ophenyl, and the benzyl ester groups have the structure -OCHR'phenyl, in which R' is H or C₁₋₆alkyl, and C₁₋₆alkyl is substituted as described above. In either case, phenyl is substituted as described above.

5

The prodrugs of this invention may therefore be defined as compounds having the formula I, in which at least one group R^5 is selected from the group consisting of C_{1-6} alkyl, phenyl, $-CHR'$ phenyl, and $-CHR'OC(=O)R''$, and the remaining groups R^5 are selected from H, C_{1-6} alkyl, phenyl, $-CHR'$ phenyl and $-CHR'OC(=O)R''$, wherein each group R' is H or C_{1-6} alkyl and each group R'' is $-C_{1-6}$ alkyl or $-OC_{1-6}$ alkyl, where C_{1-6} alkyl and the alkyl portion of $-OC_{1-6}$ alkyl may optionally be substituted with one or more substituents independently selected from 1-5 halogen atoms, a phenyl group, or a mixture of these. The phenyl group in $-CHR'$ phenyl, the phenyl group that is an optional substituent on C_{1-6} alkyl and $-OC_{1-6}$ alkyl, and the phenyl ester group that is obtained when R^5 is phenyl may optionally be substituted with 1-3 groups independently selected from halogen, $-CH_3$, $-CF_3$, $-OCH_3$ and $-OCF_3$. By this definition, at least one of the phosphonic acid groups is a monoester or diester, and each of the remaining phosphonic acid groups, if any, may be a free acid or a monoester or diester.

20

In preferred compounds, the groups R^5 that are not H may all be the same because of the difficulty of synthesizing different R^5 groups on the same phosphonates. In many cases, the prodrug will be a mixture of compounds having different levels of esterification on the phosphonic acid groups because of the difficulty of synthesizing and separating a discrete pure compound.

25

Utilities

Inhibitors of PTP-1B may improve insulin-sensitivity and thus may have utility in preventing or treating diabetes, particularly Type 2 diabetes. They may

5 also be useful for improving glucose tolerance and insulin-sensitivity when there is insulin-resistance, and for treating or preventing obesity in mammals that are in need of such treatments or that might benefit from such treatments. The compounds are expected to be useful for treating Type 2 diabetes (non-insulin dependent diabetes, or NIDDM). The compounds may also cause a beneficial reduction in triglycerides and
10 lipids.

Compounds in the present class of phosphonic acids may have certain unexpected advantages. Some of the compounds may be selective in inhibiting PTP-1B in preference to T-Cell Protein Tyrosine Phosphatase (TCPTP). This may make it possible to avoid toxic side effects due to T-Cell inhibition.

15 The compounds of this invention in general exhibit good in vitro activity for inhibiting the PTP-1B enzyme. The compounds exemplified in this application in general have an IC₅₀ value of less than 1 μ M for inhibition of the PTP-1B enzyme, and in some cases less than 0.1 μ M, as measured using the enzyme assay described herein in the assays section.

20 The PTP-1B inhibitors may also be useful in the treatment, prevention or control of a number of conditions that accompany type 2 diabetes, including hyperlipidemia, hypertriglyceridemia, hypercholesterolemia (including beneficially raising low HDL levels), atherosclerosis, vascular restenosis, pancreatitis, adipose cell tumors, adipose cell carcinomas such as liposarcoma, dyslipidemia, inflammatory
25 bowel disease, inflammation in general, and other disorders where insulin resistance is a component. Finally, the compounds may be used to treat or prevent cancer, such as prostate cancer, neurodegenerative diseases and the like.

Pharmaceutical Compositions

30 For the treatment of any of these PTP-1B-mediated diseases the active compound may be administered orally, topically, parenterally, by inhalation spray or rectally in dosage units containing conventional pharmaceutically acceptable carriers. The term parenteral as used herein includes subcutaneous, intravenous, intramuscular and intrasternal injection and infusion techniques. In addition to the treatment of
35 warm-blooded animals such as mice, rats, horses, cattle, sheep, dogs, cats, etc., the compounds of the invention are useful for the treatment of humans.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous

5 or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavouring agents, colouring agents and preserving agents in
10 order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or
15 alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or
20 glyceryl distearate may be employed. They may also be coated by the technique described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for
25 example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredients is mixed with water or miscible solvents such as propylene glycol, PEGs and ethanol, or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active material in admixture with
30 excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with
35 fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol

5 monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more colouring agents, one or more flavouring agents, and one or more sweetening agents, such as sucrose,
10 saccharin or aspartame.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening
15 agents such as those set forth above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in
20 admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the
25 form of an oil-in-water emulsion. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of
30 the said partial esters with ethylene oxide, for example polyoxy-ethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavouring and colouring agents. The
35 pharmaceutical composition may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile

5 injectable solution or suspension in a parenterally-acceptable diluent or solvent, for
example as a solution in 1,3-butanediol. Examples of vehicles and solvents include
water, Ringer's solution and isotonic sodium chloride. Cosolvents such as ethanol,
propylene glycol or polyethylene glycols may also be used. In addition, sterile, fixed
10 oils are conventionally employed as a solvent or suspending medium. For this
purpose any bland fixed oil may be employed including synthetic mono- or
diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of
injectables.

The compounds may also be administered in the form of suppositories.
These compositions can be prepared by mixing the drug with a suitable non-irritating
15 excipient which is solid at ordinary temperatures but molten at the body temperature
and will therefore release the drug. Such materials include cocoa butter and
polyethylene glycols.

For topical use, creams, ointments, gels, solutions or suspensions
containing the compound are employed. (For purposes of this application, topical
20 application includes mouth washes and gargles.) Topical formulations may include
cosolvents, emulsifiers, penetration enhancers, preservatives, emollients and the like.

The pharmaceutical composition may also be further comprised of a
second anti-diabetic or anti-obesity effective compound.

25 Dose Ranges

Dosage levels on the order of from about 0.01 mg to about 100 mg/kg
of body weight per day are useful in the treatment of the above-indicated conditions,
or alternatively about 0.5 mg to about 7 g per patient per day. For example, the
diseases and conditions described herein may be effectively treated by the
30 administration of from about 0.01 to 50 mg of the compound per kilogram of body
weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day.

The active ingredient is typically combined with the carrier to produce
a dosage form suitable for the particular patient being treated and the particular mode
of administration. For example, a formulation intended for the oral administration of
35 humans may contain from about 0.5 mg to about 5 g of the active agent, compounded
with an appropriate and convenient amount of carrier material which may vary from
about 5 to about 95 percent of the total composition. Representative dosage forms
will generally contain between from about 1 mg to about 500 mg of an active

5 ingredient, typically 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

It is understood that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug
10 combination and the severity of the particular disease undergoing therapy.

Combinations with Other Drugs

In further aspects, the invention encompasses pharmaceutical compositions for treating PTP-1B mediated diseases as defined above comprising an
15 effective amount of the active compound and one or more other pharmaceutically active compounds, such as anti-diabetic compounds (for example, insulin, sulfonyl ureas, PPAR-alpha and/or -gamma ligands, including ligands that have both PPAR-alpha and -gamma activity), anti-obesity compounds, and compounds that improve the lipid profile of the patient.

20 Thus, the methods of treatment or prevention described herein may further be comprised of administering to said patient a second anti-diabetic compound in an amount effective to treat, control, or prevent diabetes, alone or in combination with the PTP-1B inhibitors of this invention.

Similarly, the methods of treatment or prevention described herein may
25 further be comprised of administering to said patient an anti-obesity compound in an amount effective to treat, control or prevent obesity, alone or in combination with the PTP-1B inhibitors of this invention.

Similarly, the methods of treatment of diabetes may comprise the administration of a cholesterol biosynthesis inhibitor, particularly an HMG-CoA
30 reductase inhibitor, such as lovastatin, simvastatin, pravastatin, fluvastatin, atorvastatin and rivastatin, in an amount effective to improve the lipid profile. In combination with a PTP-1B inhibitor, this may be beneficial in treating or preventing atherosclerosis and other conditions that often are associated with Type 2 diabetes.

Examples of other pharmaceutically active compounds that may be
35 combined with a compound of Formula I and administered in combination with the PTP-1B inhibitors include, but are not limited to, the following compounds or compositions or groups of compounds or compositions that are used as anti-diabetes

- 5 compounds (a, b, c, d, f, and i below), anti-obesity compounds (g below), and/or compounds or compositions for lipid profile control (e and h below):

10 97/27847; (ii) biguanides such as metformin and phenformin;
 - (b) insulin or insulin mimetics;
 - (c) sulfonylureas such as tolbutamide and glipizide, or related materials;

30 commonly assigned US Applications 09/095,244 and 09/280,602.

Where a second pharmaceutical is used in addition to an active compound taught herein, the two pharmaceuticals may be administered together in a single composition, separately at approximately the same time, or on separate dosing
35 schedules. The important feature is that their dosing schedules comprise a treatment plan in which the dosing schedules overlap in time and thus are being followed concurrently.

- 5 11. 100% binding activity is defined as the enzyme-ligand binding in the presence of anti-GST antibody, but in the absence of the testing ligands with the non-specific binding subtracted.
12. Percentage of inhibition is calculated accordingly.
13. IC₅₀ value is approximated from the non-linear regression
- 10 fit with the 4-parameter/multiple sites equation (described in: "Robust Statistics", New York, Wiley, by P.J. Huber (1981) and reported in nM units.
14. Test ligands (compounds) with larger than 90% inhibition at 10 μ M are defined as actives.
- 15 Enzyme Assay PTP-1B
- Assay buffer 50 mM Bis-Tris (pH=6.3)
- 2 mM EDTA
- 5 mM N,N'-dimethyl-N,N'-bis(mercaptoacetyl)hydrazine (DMH)
- 20 Substrate 10 mM fluorescein diphosphate (FDP) store at -20°C
- Enzyme dilution buffer 50 mM Bis-Tris (pH=6.3)
- 2 mM EDTA
- 5 mM DMH
- 25 20 % (v/v) glycerol
- 0.01% Triton X-100

The assay was carried out at room temperature in 96 well plates. The reaction mixture in 170 μ l contained 50 mM Bis-Tris (pH=6.3), 2 mM

30 EDTA, 5 mM N,N'-dimethyl-N,N'-bis(mercaptoacetyl)hydrazine (DMH) and 10 μ M fluorescein diphosphate (FDP). 10 μ l of 10 concentrations (serial dilution) of the test compound (inhibitor) dissolved in DMSO or DMSO alone for control was added to each well and the plate was mixed for 2 min. The reaction was initiated by adding 20 μ l of diluted PTP-1B (50 nM in 50 mM Bis/Tris (pH=6.3), 2 mM

35 EDTA, 5 mM DMH, 20 % glycerol and 0.01% Triton X-100. The phosphatase activity was followed by monitoring the appearance of the fluorescent product fluorescein monophosphate (FMP) continuously for 15-30 min, using the Cytofluor II plate reader (PerSeptive Biosystems Inc.) with excitation of 440 nm

- 5 (slit width 20 nm) and emission at 530 nm (slit width 25 nm). All the assays were done at least in duplicate. The initial rate of FMP formation is plotted against the concentration of inhibitor and the data was fitted to 4-parameter equation and the inflection point of the fit is the IC₅₀.

10 PHARMACOKINETICS IN RATS

Per Os Pharmacokinetics in Rats

PROCEDURE:

- 15 The animals are housed, fed and cared for according to the Guidelines of the Canadian Council on Animal Care.

Male Sprague Dawley rats (325-375 g) are fasted overnight prior to each PO blood level study.

- 20 The rats are placed in the restrainer one at a time and the box firmly secured. The zero blood sample is obtained by nicking a small (1 mm or less) piece off the tip of the tail. The tail is then stroked with a firm but gentle motion from the top to the bottom to milk out the blood. Approximately 1 mL of blood is collected into a heparinized vacutainer tube.

- 25 Compounds are prepared as required, in a standard dosing volume of 10mL/kg, and administered orally by passing a 16 gauge, 3" gavaging needle into the stomach.

Subsequent bleeds are taken in the same manner as the zero bleed except that there is no need to nick the tail again. The tail is cleaned with a piece of gauze and milked/stroked as described above into the appropriately labelled tubes.

- 30 Immediately after sampling, blood is centrifuged, separated, put into clearly marked vials and stored in a freezer until analysed.

Typical time points for determination of rat blood levels after PO dosing are:

0, 15min, 30min, 1h, 2h, 4h, 6h

- 35 After the 4 hr time point bleed, food is provided to the rats *ad libitum*. Water is provided at all times during the study.

Vehicles:

5 The following vehicles may be used in PO rat blood level determinations:

| | | |
|----|-----------------------|-----------------------|
| | PEG 200/300/400: | restricted to 2 mL/kg |
| | Methocel 0.5% - 1.0%: | 10mL/kg |
| 10 | Tween 80: | 10mL/kg |

Compounds for PO blood levels can be in suspension form. For better dissolution, the solution can be placed in a sonicator for approximately 5 minutes.

For analysis, aliquots are diluted with an equal volume of acetonitrile and centrifuged to remove protein precipitate. The supernatant is injected directly
15 onto a C-18 HPLC column with UV detection. Quantitation is done relative to a clean blood sample spiked with a known quantity of drug. Bioavailability (F) is assessed by comparing area under the curve (AUC) i.v. versus p.o.

$$20 \quad F = \frac{AUC_{po}}{AUC_{iv}} \times \frac{DOSE_{iv}}{DOSE_{po}} \times 100\%$$

Clearance rates are calculated from the following relation:

$$25 \quad CL = \frac{DOSE_{iv}(mg/kg)}{AUC_{iv}}$$

The units of CL are mL/h•kg (milliliters per hour kilogram)

30 Intravenous Pharmacokinetics in Rats

PROCEDURE:

The animals are housed, fed and cared for according to the Guidelines of the Canadian Council on Animal Care.

35 Male Sprague Dawley (325-375 g) rats are placed in plastic shoe box cages with a suspended floor, cage top, water bottle and food.

The compound is prepared as required, in a standard dosing volume of 1 mL/kg.

5 Rats are bled for the zero blood sample and dosed under CO₂ sedation. The rats, one at a time, are placed in a primed CO₂ chamber and taken out as soon as they have lost their righting reflex. The rat is then placed on a restraining board, a nose cone with CO₂ delivery is placed over the muzzle and the rat restrained to the board with elastics. With the use of forceps and scissors, the jugular vein is exposed and the zero sample taken, followed by a measured dose of compound which is injected into the jugular vein. Light digital pressure is applied to the injection site, and the nose cone is removed. The time is noted. This constitutes the zero time point.

15 The 5 min bleed is taken by nicking a piece (1-2 mm) off the tip of the tail. The tail is then stroked with a firm but gentle motion from the top of the tail to the bottom to milk the blood out of the tail. Approximately 1 mL of blood is collected into a heparinized collection vial. Subsequent bleeds are taken in the same fashion, except that there is no need to nick the tail again. The tail is cleaned with a piece of gauze and bled, as described above, into the appropriate labelled tubes.

20 Typical time points for determination of rat blood levels after I.V. dosing are either:

0, 5 min, 15min, 30min, 1h, 2h, 6h

or 0, 5 min, 30min, 1h, 2h, 4h, 6h.

25

Vehicles:

The following vehicles may be used in IV rat blood level determinations:

30 Dextrose: 1mL/kg
2-Hydroxypropyl- β -cyclodextrin 1mL/kg
DMSO (dimethylsulfoxide): Restricted to a dose volume of 0.1 mL per animal
PEG 200: Not more than 60% mixed with 40% sterile water - 1mL/kg

35 With Dextrose, either sodium bicarbonate or sodium carbonate can be added if the solution is cloudy.

For analysis, aliquots are diluted with an equal volume of acetonitrile and centrifuged to remove protein precipitate. The supernatant is injected directly

5 onto a C-18 HPLC column with UV detection. Quantitation is done relative to a clean blood sample spiked with a known quantity of drug. Bioavailability (F) is assessed by comparing area under the curve (AUC) i.v. versus p.o.

$$10 \quad F = \frac{\text{AUC}_{\text{po}} \times \text{DOSE}_{\text{iv}}}{\text{AUC}_{\text{iv}} \times \text{DOSE}_{\text{po}}} \times 100\%$$

Clearance rates are calculated from the following relation:

$$15 \quad \text{CL} = \frac{\text{DOSE}_{\text{iv}}(\text{mg/kg})}{\text{AUC}_{\text{iv}}}$$

The units of CL are mL/h•kg (milliliters per hour kilogram).

PTP 1B INTACT CELL ASSAY

20

This assay is the subject of copending, commonly assigned US Provisional Application No. 60/123,243, filed March 8, 1999, which patent application is incorporated herein by reference, and was recently published in Cromlish, Wanda A., Paul Payette and Brian P. Kennedy (1999) *Biochem Pharmacol* 25 58: 1539-1546.

Construction of Recombinant Baculovirus Transfer Vectors And Insect Cells

Briefly, using the Bac-to-Bac Baculovirus Expression System (Gibco-
30 BRL, Mississauga, Ontario, Canada) PTP 1B cDNA (obtained from Dr. R. L. Erikson, Harvard University, USA), is cloned into the pFASTBAC donor plasmid engineered to include a FLAG sequence at the 5' end of the cDNA (PTP1B-FL). The recombinant plasmid is transformed into competent DH10BAC *E. Coli* cells. Following transposition and antibiotic selection, the recombinant bacmid DNA is
35 isolated from selected *E. Coli* colonies and used to transfect sf9 insect cells (Invitrogen, San Diego, CA, U.S.A.). The sf9 cells are cultured in spinner flasks at 28° C in Graces supplemented medium (Gibco-BRL, Mississauga, Ontario, Canada)

- 5 with 10% heat-inactivated fetal bovine serum (Gibco-BRL) following the protocol of Summers and Smith (*A manual for Methods for Baculovirus Vectors and Insect Culture Procedures*(Bulletin No. 1555). Texas A & M University, Texas Agricultural Experiment Station, College Station, TX, 1987).

10 Intact Cell Assay

- Infected sf9 cells expressing PTP1B-FL and mock infected cells, are harvested at 29 hpi (hours post infection) by gentle centrifugation (Beckman GS-6R) at 460 rpm, (48 g) for 5 min. Cells are washed once in assay buffer (Hanks' solution buffered with 15 mM Hepes, pH 7.4, obtained from Sigma, St. Louis, MO, U.S.A.)
- 15 and recentrifuged at 300 rpm (21 g) for 10 min. The cells are then gently resuspended in assay buffer and examined using a hemacytometer for cell density and viability by trypan blue exclusion. Assays are performed using a Tomtec Quadra 96 pipeting robot, programmed to mix the cells gently after each addition. In 200 μ L of assay buffer, 2×10^5 PTP expressing cells or mock infected cells are dispensed into each
- 20 well of 96-well polypropylene plates and pre-incubated either with a test compound or DMSO vehicle (3 μ L), for 15 min at 37°C. The pre-incubated cells are challenged with a final concentration of 10 mM pNPP (p-nitrophenyl phosphate, obtained from Sigma-Aldrich Canada Ltd., Oakville, Ontario) for 15 min, centrifuged at 4°C and the amount of substrate hydrolysis is determined spectrophotometrically at OD₄₀₅.

25

Oral Glucose Tolerance Test

Oral glucose tolerance tests are done on conscious Zucker obese *fa/fa* rats or obese *ob/ob* mice (age 12 weeks or older). The animals are fasted for 16-18 hours before use for experiments. A test compound or a vehicle is given either

- 5 intraperitoneally or orally 60 minutes before oral administration of a glucose solution at a dose of 2 g/kg body weight. Blood glucose levels are measured using a Medisense glucometer from tail bled samples taken at different time points before and after administration of glucose. A time curve of the blood glucose levels is generated and the area-under-the-curve (AUC) for 120 minutes is calculated (the time of glucose administration being time zero). Percent inhibition is determined using the AUC in the vehicle-control group as zero percent inhibition.

- In separate studies, C57BL/6J mice are fed a high fat (35%) and high carbohydrate (36 %) diet obtained from Bioserv (Frenchtown, NJ) for 3 to 4 weeks, at which time the mice gained 50 - 100% of the baseline body weight. Oral glucose tolerance tests are done in the same manner as described above.

5 Methods of Synthesis

The compounds of the present invention can be prepared according to the following methods.

10

METHOD A

An appropriately substituted aniline **1**, from commercial sources or prepared from readily available starting material, is diazotized and converted to the corresponding cyano intermediate **2** under Sandmeyer's condition. Compound **2** is
15 then reduced with DIBAL-H from -78°C to room temperature to give the hydroxymethyl benzaldehyde **3**. The hydroxyl group of **3** is converted to the bromo group by the treatment with a brominating mixture such as POBr_3 and DMF to give bromide **4**. The aldehyde of **4** is reacted with an anion derived from dialkyl phosphite and a base such as $\text{LiN}(\text{TMS})_2$ to afford the hydroxy intermediate **5**. Oxidation of **5**
20 with MnO_2 or under Swern's condition provides the ketophosphonate **6**. Treatment with DAST then gives bromide **7**.

5

R^a is a substituent, which is part of an ester group, and can be selected independently.

5

METHOD B

An appropriately substituted difluoromethylphosphonic acid dialkyl ester **7** is reacted with potassium thioacetate in DMF to give the corresponding thioacetate **8**.

10

5

METHOD C

- 4'-Methoxy-4-methylbiphenyl **9** is prepared from the Suzuki reaction of 4-methylbenzeneboronic acid and 4-bromoanisole. The methyl ether is then cleaved with a Lewis acid such as BBr_3 to give phenol **10**. The hydroxyl intermediate is converted to the phosphate intermediate **11** followed Purnanand's condition (Tet. Lett., 1989, 30, 1687). Base promoted rearrangement with a base such as LDA provides the hydroxyl phosphonate intermediate **12**. Alkylation with an alkyl halide in the presence of a base such as NaOH in a solvent such as DMF or with an alcohol under Mitsunobu reaction condition gives an alkoxy phosphonate intermediate **13**.
- 15 Bromination with NBS provides the bromomethyl intermediate **14** for subsequent alkylation reaction.

R^b is a substituent, which is part of the coupling reagent, and can be selected independently.

5

METHOD D

An appropriately substituted iodo or bromo benzoate is coupled with a (hydroxymethyl)benzene boronic acid under Suzuki's condition to give an alcohol intermediate **15**. Treatment of **15** with a brominating mixture such as NBS and Ph₃P gives bromide **16**.

X = H, F, Cl, Br, OH, OR^b

5

METHOD E

The phenol intermediate **12** from Method C is converted to the corresponding triflate **17**, which is coupled with a boronic acid under Suzuki's conditions or a tin reagent under Still's conditions to provide **18**. Bromination with NBS then gives bromide **19**.

10

R^c is a substituent which is part of the reagent.

5

METHOD F

2-Methyl-6,8-dibromo quinoline **20** is coupled with a boronic acid such as 4-(hydroxymethyl)benzene boronic acid under Suzuki's condition to give an alcohol intermediate. The hydroxyl group is protected as a silyl ether or a THP ether to provide **21**. Monoalkylation gives **22**. Repeating of the alkylation with a second electrophile yields **23**. Treatment of **23** with a dialkyl phosphite in the presence of a Pd(0) catalyst affords **24**. Deprotection of the hydroxyl protecting group gives **25**, which is converted to the bromide **26** by POBr₃/DMF condition.

15

R^b is a substituent, which is part of the reagent, and can be selected independently.

5

METHOD G

Bromoquinoline intermediate **23** from Method F is treated with n-BuLi, reacted with CO₂ and converted to the ester intermediate **27**. Compound **27** is then transformed to the bromide **29** as described in Method F.

10

5

METHOD H

Bromoquinoline intermediate **23** from Method F is treated with n-BuLi, reacted with DMF to give aldehyde intermediate **30**. The aldehyde is reduced, transformed to the bromide, reacted with NaCN and converted to the methyl ester **31**.

10 Compound **31** is then transformed to the bromide **33** as described in Method F.

5

METHOD I

Bromoquinoline **21** from Method F is reacted with diethylphosphite in the presence of a Pd(0) catalyst to give **34**. Reaction with SeO₂ provides aldehyde **35**, which is reacted with a Grignard reagent to afford alcohol **36**. Oxidation of **36** with MnO₂ yields ketone **37**. The ketone intermediate is converted to the bromide **38** as described in Method F.

5

METHOD J

The ketone intermediate **37** from Method I is reacted with a Grignard reagent and converted to the methyl ether **39**, which is transformed to the bromide **40** as described in Method F.

10

5

METHOD K

- An appropriately substituted iodo-toluene **41** is brominated with NBS to give bromide **42**, which is then coupled with a thiol or thioacetate to give sulfide **43**. Sulfide **43** undergoes a copper halide-mediated cross coupling reaction with
- 10 [(diethoxyphosphinyl)difluoromethyl]zinc bromide (Tetrahedron, **1997**, *53*, 815.) to give **44**. Deprotection of **44** with TMS-Br or aqueous HOAc and may require additional deprotection reaction(s) for R to give **45**.

5

METHOD L

The thioacetate **8**, prepared according to Method B, is reacted with an electrophile, either prepared from a suitable method as described for the present invention or from commercial sources, to give the sulfide intermediate **44**.

- 10 Deprotection of **44** with TMS-Br or aqueous HOAc and following by soaponification for R containing an ester group to give **45**.

5

METHOD M

The sulfide intermediate **44** from Method L is oxidized to the sulfone **46**, which is deprotected as described in Method L to give **47**.

METHOD N

15 Various substituted bromothioanisole **48** can be oxidized to the corresponding sulfone **49** by mCPBA. Palladium catalyzed coupling of the resulting bromosulfone with 4-hydroxymethylphenylboronic acid gives the corresponding biphenyl benzyl alcohol **50**. Treatments of the alcohol **50** with POBr_3 gives the benzyl bromide **51**.

5

METHOD O

Compound **45** from Method L is treated with one equivalent or two equivalent of an oxidizing agent such as MMPP or mCPBA to give the corresponding sulfoxide **52** or sulfone **53** products.

10

METHOD P

15

The bromide **7**, prepared according to Method A, is reacted with an appropriate thiol to give the sulfide intermediate **44**. Deprotection of **44** with TMS-Br or aqueous HOAc and following by saponification for R containing an ester group to give **45**.

5

METHOD Q

Thioacetate **54** is reacted with bromide **7**, prepared according to Method A, to give the sulfide intermediate **44**. Deprotection of **44** with TMS-Br or aqueous HOAc and may require additional deprotection reaction(s) for R to give **45**.

10

5

METHOD R

An appropriately substituted aniline **55** from commercial sources or prepared from readily available starting material, is diazotized and converted to the corresponding cyano intermediate **56** under Sandmyer's condition. Compound **56** is then reduced with DIBAL-H from $-78\text{ }^{\circ}\text{C}$ to room temperature to give the hydroxymethyl benzaldehyde **57**. The hydroxyl group of **57** is converted to the bromo group by the treatment with a brominating mixture such as N-bromosuccinimide and triphenylphosphine to give bromide **58**. The aldehyde of **58** is reacted with an anion derived from dialkyl phosphite and a base such as $\text{LiN}(\text{TMS})_2$ to afford the hydroxy intermediate **59**. Oxidation of **59** with MnO_2 or under Swern's condition provides the ketophosphonate **60**. Treatment with DAST then gives bromide **61**. Bromide **61** is then reacted with an appropriate thiol or thioacetate to give the sulfide intermediate **62**. Deprotection of **62** with TMS-Br or aqueous HOAc and may require additional deprotection reaction(s) for R to give **63**.

20

5

 $\text{Y} = (\text{CH}_2)_n, n = 1 - 3.$

5

METHOD S

Intermediate **44**, prepared from an appropriate method described above, can undergo further transformation reactions such as Suzuki reaction, oxidation reaction, and/or reduction reaction on R¹. Deprotection of the resulting
10 intermediate with TMS-Br or aqueous HOAc and may require additional deprotection reaction to liberate functional group for R to give **45**.

5

METHOD T

Bromide **7**, prepared according to Method A is converted to aldehyde **64** using an amine-oxide such as N-methylmorpholine-N-oxide. Aldehyde **64** is then converted to olefin **65**. Olefin **65** is further transform to alcohol intermediate **66** via an oxymercuration-demercuration sequence. The hydroxy group of **66** is converted to a good leaving group such as mesylate, reacted with a thiol or thioacetate in the presence of a base and followed by deprotection reaction(s) to give **67**.

15

5

METHOD U

A heterocyclic(or aromatic) halide(or triflate) **68** is converted to a silyl sulfide intermediate **69** [Tetrahedron, 35, 3225 – 3226 (1994), Tetrahedron, 37, 4523 – 4524 (1996)]. Sulfide **69** is then reacted with bromide **7** in the presence of a fluoride ion to give the coupling product **44**. Deprotection of **44** with TMS-Br or aqueous HOAc and may require additional deprotection reaction(s) for R to give **45**.

SYNTHESIS OF INTERMEDIATES FOR USE IN SYNTHETIC EXAMPLES

Thioacetic acid S-{4-[(diethoxyphosphoryl)difluoromethyl]benzyl ester

- 10 A solution of (4-bromomethylphenyl)difluoromethylphosphonic acid diethyl ester (4.0 g, 11.2 mmol) in DMF (30 mL) was purged with a stream of N₂ for 15 min, then cooled to 0 °C. Powdered potassium thioacetate (1.5 g, 13.2 mmol) was added. The mixture was stirred at 0 °C for 1h. After dilution with H₂O, the mixture was extracted with EtOAc. The EtOAc extract was washed with H₂O (2x), dried (MgSO₄) and
- 15 concentrated. Chromatography over silica gel and elution with hexanes:EtOAc (1.5:1) gave 3.5 g (89%) of the title compound as a light brown oil.

¹H NMR (Acetone-d₆) δ 7.50 (m, 4H), 4.15 (m, 6H), 2.34 (s, 3H), 1.26 (t, 6H).

20

(2-Bromo-4-bromomethylphenyl)difluoromethylphosphonic acid diethyl esterStep1: Ethyl 4-amino-3-bromobenzoate

- 25 To a mechanical stirred solution of ethyl 4-aminobenzoate (165 g, 1mol) in THF (1.2 L) and pyridine (200 mL) at ~ 10 °C was added portionwise (~ 10 – 20 g each time) of pyridine hydrobromide perbromide (tech. 90%, 365 g, 1.02 mol) over a period of 1h. Internal temperature was kept at 10 –10 °C. After completion of addition, the mixture was stirred for 30 min, then filtered through celite and the filter cake was washed with
- 30 THF (1 L). The filtrate was diluted with Et₂O, washed with 0.5 M of aqueous NaHSO₃ (2x, 400 mL), brine, dried (MgSO₄) and concentrated. The residue contained too much H₂O and therefore was dissolved in EtOAc (1L), washed with brine, dried (MgSO₄) and concentrated to give a semi-solid residue. The residue was swished with hexanes-Et₂O (2:1) to yield 187 g (77%) of the title compound as a
- 35 white powder. The mother liquor was evaporated and swished again to give 19 g (8%) of additional title compound as a light brown powder.

- 5 ¹H NMR (Acetone-d₆) δ 8.00 (s, 1H), 7.72 (d, 1H), 6.88 (d, 1H), 5.68 (br s, 2H), 4.25 (q, 2H), 1.31 (t, 3H).

Step 2: Ethyl 3-bromo-4-cyanobenzoate

- 10 To a three necked 3L round bottomed flask with a mechanical stirrer was added 3M aqueous HCl (790 mL), followed by ethyl 4-amino-3-bromobenzoate (195 g, 0.8 mol) and the mixture was stirred for 15 min. After cooling to 5 °C, a solution of 4M aqueous NaNO₂ (240 mL, 0.96 mol) was added over a period of 30 - 45 min. The resulting mixture was further stirred for 30 min. and an almost homogenous solution
- 15 was obtained. The mixture was filtered through glass wool to remove the insoluble residue. The solution was then added to a vigorously stirred solution of CuCN (111 g, 1.24 mol) and NaCN (162 g, 3.3 mol) in H₂O (1 L) and EtOAc (500 mL) at room temperature in a 6L Erlenmeyer flask over ~ 45 min. The resulting mixture was further stirred at r.t. for 30 min., filtered through celite and extracted with EtOAc.
- 20 The EtOAc extract was washed with brine, 0.5 M aqueous NaOH, dried (MgSO₄) and concentrated. Chromatography over silica gel and elution with hexanes:EtOAc (6:1), then (3:1), swished with hexanes and small amount of Et₂O to give a light brown powder. The mother liquor was concentrated and swished again. Combined yield of the title compound was 119 g (58%).
- 25 ¹H NMR (Acetone-d₆) δ 8.33 (s, 1H), 8.15 (d, 1H), 8.02 (d, 1H), 4.40 (q, 2H), 1.38 (t, 3H).

Step 3: 2-Bromo-4-hydroxymethyl-benzaldehyde

- 30 To a stirring cold (-78 °C) solution of ethyl 3-bromo-4-cyanobenzoate (0.41 mol, 104 g) in THF (2.3 L) was added dropwise a solution of diisobutylaluminum hydride (2.0 mol, 1.36 L; 1.5 M in toluene) over a period of 1.5 h. After addition was completed, the mixture was warmed to rt over a period of 3 h. The mixture was then cooled to 0-5
- 35 °C and 40 ml of acetone was added slowly. The mixture was then transferred via a cannula to a cold (0 °C) stirring aqueous solution of HCl (2.2 L 3 N) over a period of 1.5 h, maintaining the temperature of the aqueous solution below 30 °C. After the transfer was completed, the mixture was stirred for another 0.25 h. The organic

5 solution was separated and the aqueous was extracted twice with EtOAc (3 L). The combined organic extracts were washed with brine, dried with MgSO₄ (anhyd.) and concentrated to give 74 g (83%) of the title compound as a light yellow solid.

¹H NMR (Acetone-d₆) δ 10.28 (s, 1H), 7.82 (d, 1H), 7.74 (s, 1H), 7.52 (d, 1H), 4.74
10 (d, 2H), 4.60 (t, 1H).

Step 4: 2-Bromo-4-bromomethyl-benzaldehyde

To a stirring cold (0°C) solution of POBr₃ (0.6 mol, 171 g) in CH₂Cl₂ (1.6 L) was
15 added dropwise DMF (0.75 L) over a period of 1 h. A solution of 2-bromo-4-hydroxymethyl-benzaldehyde (0.49 mol, 107 g) in CH₂Cl₂ (0.75 L) was then added dropwise over a period of 0.5 h. The resulting mixture was stirred at 0°C for another 0.5 h and was then transferred via a cannula to a cold (0 °C) stirring aqueous solution of NaHCO₃ (3 L, 1M) while maintaining the temperature of the aqueous solution
20 below 10 °C. After the transfer was completed, the mixture was extracted with CH₂Cl₂ (2 L). The organic extract was separated and washed with H₂O (3 L) and brine (3 L), dried with MgSO₄ (anhyd.) and concentrated to give an oil . The residue was extracted with 10% EtOAc/hexane (2 L). The organic extract was washed with H₂O (2 x 1 L), dried with MgSO₄ (anhyd.) and concentrated to a solid which was swished
25 with hexane to give 154 g (~100%) of the title compound as a beige solid.

¹H NMR (Acetone-d₆) δ 10.30 (s, 1H), 7.88 (s, 1H), 7.84 (d, 1H), 7.65 (d, 1H), 4.70 (s, 2H).

30 Step 5: (2-bromo-4-bromomethyl-phenyl)-hydroxy-methyl-phosphonic acid diethyl ester

To a - 60-65 °C THF(200 mL) solution of diethyl phosphite (110 mmol., 15.2 g) was added 1.06 M (hexanes) LiHMDSi (110 mmol., 103 mL) dropwise (0.5 hour) and the
35 mixture was stirred for 0.75 hour at -60-65 °C. It was then transferred dropwise (1 hour) via a canula into a - 60-65 °C THF (200 mL) solution of 2-bromo-4-bromomethyl-benzaldehyde (100 mmol., 27.8 g). The mixture was stirred for 1 hour at - 60-65 °C. The mixture was then transferred via a canula into a vigorously stirred

5 mixture of ice, water (1.5 L), 1N HCl (300 mL), ether (500 mL) and ethyl acetate (100 mL). The organic layer was separated and the aqueous further extracted with 1:1 ether:ethyl acetate (200 mL). The combined organic layers were washed with water (1L), brine, dried with magnesium sulphate, filtered and the solvents were removed *in vacuo*. The residue was swished in ether at 0 °C to yield the title compound (38 g).

10

¹H NMR (Acetone-d₆) δ 7.8(1H, dd), 7.7(1H, s), 7.5(1H, d), 5.35-4.6(2H, m), 4.65(2H, s), 3.85-4.2(4H, m), 1.1-1.3(6H, 2t).

Step 6: (2-bromo-4-bromomethyl-benzoyl)-phosphonic acid diethyl ester

15

To – 60-65 °C CH₂Cl₂ (100 mL) solution of oxalyl chloride (50 mmol., 6.35 g) was added dropwise a CH₂Cl₂ (40 mL) solution of DMSO (62 mmol., 4.8 g) over 0.2 hour and the mixture was stirred for 0.5 hour. A CH₂Cl₂ and DMSO solution (40 and 4 mL) of the hydroxy-phosphonate (40 mmol., 16.6 g) was then added via a canula over 20 0.2 hour and the mixture was stirred at –60-65 °C for 0.25 hour. Step 1: Thioacetic acid S-(4-bromobenzyl)ester

To a solution of 4-bromobenzyl bromide (5g) in dimethyl formamide (75 mL) was added potassium thioacetate (2.74 g) and the mixture was stirred over night. A saturated solution of ammonium chloride was added to the mixture which was extracted with ethyl acetate, washed with brine (3x) and dried over magnesium sulfate. Evaporation of the solvent under reduced pressure followed by filtration on silica gel with 20 %ethyl acetate/hexane afforded, after evaporation of the solvent, 4.4 g of thioacetic acid S-(4-bromobenzyl)ester.

35

Step 2: [2-Bromo-4-(4-bromobenzylsulfanylmethyl)-phenyl]difluoromethylphosphonic acid diethyl ester

5

To a solution of thioacetic acid S-(4-bromobenzyl)ester (135 mg) and (2-bromo-4-bromomethylphenyl)-difluoromethylphosphonic acid diethyl ester (200 mg) in ethanol (5 mL) was added sodium methoxide (60 mg) and the mixture was stirred over night. A saturated solution of ammonium chloride was added to the mixture which was
10 extracted with ethyl acetate, washed with brine and dried over magnesium sulfate. Purification by silica gel chromatography using 30% ethyl acetate/hexane afforded 196 mg of [2-bromo-4-(4-bromobenzylsulfanylmethyl)-phenyl]-difluoromethylphosphonic acid diethyl ester.

15 Second alternative synthesis of [2-bromo-4-(4-bromobenzylsulfanylmethyl)-phenyl]difluoromethylphosphonic acid diethyl ester via a CuBr-mediated cross coupling reaction of [(diethoxyphosphinyl)difluoromethyl]zinc bromide with an iodide intermediate.

20 Step 1: 2-Bromo-4-(bromomethyl)-1-iodobenzene

To 2-bromo-1-iodo-4-methylbenzene (10 g, 33.8 mmol) was added N-bromosuccinimide (6.6 g, 37.1 mmol) in CCl₄ (150 mL) with catalytic amount of benzoyl peroxide and the mixture was irradiated with a sunlamp under refluxing for
25 1h. The mixture was then filtered on a pad of celite and evaporated to dryness. The residue was purified by silica gel chromatography to provide 9.0 g of the title compound.

Step 2: 2-Bromo-4-[(4-bromobenzyl)sulfanylmethyl]-1-iodobenzene

30

To 2-bromo-4-(bromomethyl)-1-iodobenzene (0.49 g, 1.28 mmol) and thioacetic acid S-(4-bromobenzyl)ester (0.31 g, 1.28 mmol) in EtOH (6.4 mL) was added a solution of 1M potassium tert-butoxide (1.4 mL, 1.4 mmol) in THF at -78 °C. The temperature was then raised to room temperature. The reaction mixture was quenched
35 with saturated NH₄Cl and extracted with EtOAc. The extract was dried over anhydrous Na₂SO₄ and concentrated. The residue was purified on silica gel leading to the title compound.

- 5 Step 3: [2-Bromo-4-(4-bromobenzylsulfanylmethyl)-
phenyl]difluoromethylphosphonic acid diethyl ester

To a stirred suspension of Zn dust (66 mg, 1.0 mmol) in dry DMA (0.5 mL) was added slowly a solution of bromodifluoromethyl diethylphosphonate (270 mg, 1 mmol). During addition of half the amount of the phosphonate, an exothermic reaction occurred. The addition was controlled so that the internal temperature was maintained at 50 °C. After the addition was completed, the solution was stirred at room temperature for 3h. Then CuBr (145 mg, 1mmol) was added in one portion. The mixture was stirred at room temperature for 30 min to give the organocopper reagent in DMA. The aryl iodide intermediate (250 mg, 0.5 mmol) from step 2 in DMA (0.2 mL) was added at room temperature. The mixture was then sonicated overnight, quenched with saturated aqueous NH₄Cl and extracted with EtOAc. The extract was dried over Na₂SO₄ and evaporated. The residue was purified on silica gel to give 145 mg of the title compound.

The ethyl acetate layer was separated and the aqueous further extracted with ethyl acetate. The combined organic extracts were washed with brine and dried with magnesium sulfate. Removal of the solvent left a residue which was purified by

2-{3-[4-({[4-(Difluorophosphonomethyl)-3-bromophenyl]methylthio}methyl)phenyl]phenyl}-4-methylpentanoic acid

10 Step 1: 2-(3-Bromophenyl)-4-methylpentanoic acid

Under nitrogen a 72L round bottom flask equipped with a mechanical stirrer, a nitrogen inlet, a thermocouple and addition funnel was charged with 3-bromophenylacetic acid (1.8kg), THF (9L), and DMPU (1.8L). The mixture was cooled to -20°C with a MeOH/dry ice bath. 1-Iodo-2-methylpropane (1.6Kg) was added and the temperature re-adjusted to -20°C. LiHMDS (1M in THF) 17.6L was added via addition funnel over ~3 hours maintaining a temperature of -19°C to -22°C.

The batch was aged for 4 hours at -18°C to -20°C. The batch was allowed to warm to room temperature overnight. A sample assayed by HPLC indicated that all starting material was consumed. The batch was cooled to -5°C and HCl (6N, 5.5L) added over 2 hours maintaining the temperature <20°C. The batch was transferred to a 100L cylindrical vessel and the lower aqueous layer separated. The THF layer was concentrated on the rotavap (<40°C) to yield a viscous oil (3.1Kg). The oil was dissolved in a pre-mixed solution of methanol (7.2L) and water (2.1L) in a 50L round bottom flask. The temperature was adjusted to 20-22 °C, and water (0.5L) added, followed by seed (10g). The batch was aged for 1 hour during which crystallization occurred. Water (8.1L) was added over 3 hours and the batch aged overnight at room temperature. The batch was filtered and the cake washed with methanol/water (2/3 v/v 2 X 3L). The cake was dried under vacuum at 30 °C for 24 hours to yield 2090g, (92wt % by HPLC), 1886 assay g, 85% yield.

The following procedure was the general condition for synthesis from (2-bromo-4-bromomethylphenyl)-difluoromethylphosphonic acid diethyl ester with a thiol:

15

A stock solution of (2-bromo-4-bromomethylphenyl)-difluoromethylphosphonic acid diethyl ester (410 mg) in THF (4.7 mL) was prepared, 0.2 mL of this stock solution was mixed with a stock solution (0.25mL) of a thiol and KOtBu (0.26mM of thiol in 1 mL of ethanol and 0.26 mL of KOtBu 1M in THF). The mixture was stirred over night. The solvent was evaporated under vacuum. Chloroform (1mL) was added and the mixture evaporated again.

To the above coupling product was added 1.5 mL of a stock solution, prepared from bromotrimethylsilane (8.5 mL) in chloroform (112 mL), and the resulting mixture was stirred over night. The solvent was evaporated under vacuum, then 1 mL of chloroform was added and the solvent was again evaporated under vacuum. To the residue was added 0.25 mL of dichloromethane and 1 mL of ethanol and the mixture was stirred 2 hrs. The solvent was evaporated under vacuum and the residue was purified by LC/MS (using an X-Terra MS C₁₈ 5 μ M 19x50 mm HPLC column, with a gradient from 90% water-5 % CH₃CN- 5 % 60mM NH₄OAc to 20% water-75 % CH₃CN- 5 % 60mM NH₄OAc over 10 minutes using a Micromass ZMD mass spectrum, negative ion electrospray for detection) to afford the title compound. FURTHER INFORMATION CONTINUED FROM PCT/SA/ 210

Continuation of Box I.2

Present claims 1, 2, 19, 35, 36 relate to a compound defined by reference to a desirable characteristic or property, namely being a prodrug of compounds of formula I.

The claims cover all compounds having this characteristic or property, whereas the application provides support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT for only a very limited number of such compounds. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Independent of the above reasoning, the claims also lack clarity (Article 6 PCT). An attempt is made to define the compound by reference to a result to be achieved. Again, this lack of clarity in the present case is such as to render a meaningful search over the whole of the claimed scope impossible. Consequently, the search has been carried out for those parts of the claims which appear to be clear, supported and disclosed, namely those parts relating to the prodrug compounds as defined in the description (see page 24, lines 6-24 and examples)

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
